

Overview of ImageCLEF 2016

The screenshot shows the website for ImageCLEF / LifeCLEF - Multimedia Retrieval in CLEF. The page has a blue header with the ImageCLEF logo and a yellow key icon. Below the header, there is a navigation menu on the left and a main content area on the right. The main content area displays the title 'ImageCLEF 2016' with a 'View' button and a 'Revisions' link. Below this, there is a section titled 'Motivation' with a 'Tweets by @imageclef' link. The text in the 'Motivation' section describes the ImageCLEF 2016 evaluation campaign as part of The CLEF Initiative labs, mentioning the Conference and Labs of the Evaluation Forum (CLEF) 2016 held in Évora, Portugal, from 5-8 September 2016.

ImageCLEF 2016 [View](#) [Revisions](#)

Motivation [Tweets by @imageclef](#)

ImageCLEF 2016 is an evaluation campaign which is being organized as part of [The CLEF Initiative](#) labs. The results of this campaign, including selected works among the participants, will be presented in the [Conference and Labs of the Evaluation Forum \(CLEF\) 2016](#) which will be held in the city of Évora in Portugal, 5-8 September 2016. For the 2016

Mauricio Villegas
(on behalf of all organisers)

ImageCLEF history

- Started in 2003 with a photo retrieval task
 - 4 participants submitting results
- In 2009 we had 6 tasks and 65 participants
- Previous editions, 2014 and 2015
 - 4 tasks, 13 and 25 working notes, respectively
- Current edition, 2016
 - 3 tasks: medical figures, web images, scanned handwriting
 - 98 registrations, 54 signed EUA
 - 19 participants, 15 working notes papers

ImageCLEF objectives

- Automatic image **annotation** and **retrieval** for a wide range of source images and annotation objectives
 - General imagery but also domain specific
- Annotating to allow **language-independent** indexing and retrieval from image collections
- Use of **multimodal** information: textual, visual, 3D, etc.
- Evaluation of **machine learning** and **natural language processing** approaches

Tasks organised in 2016

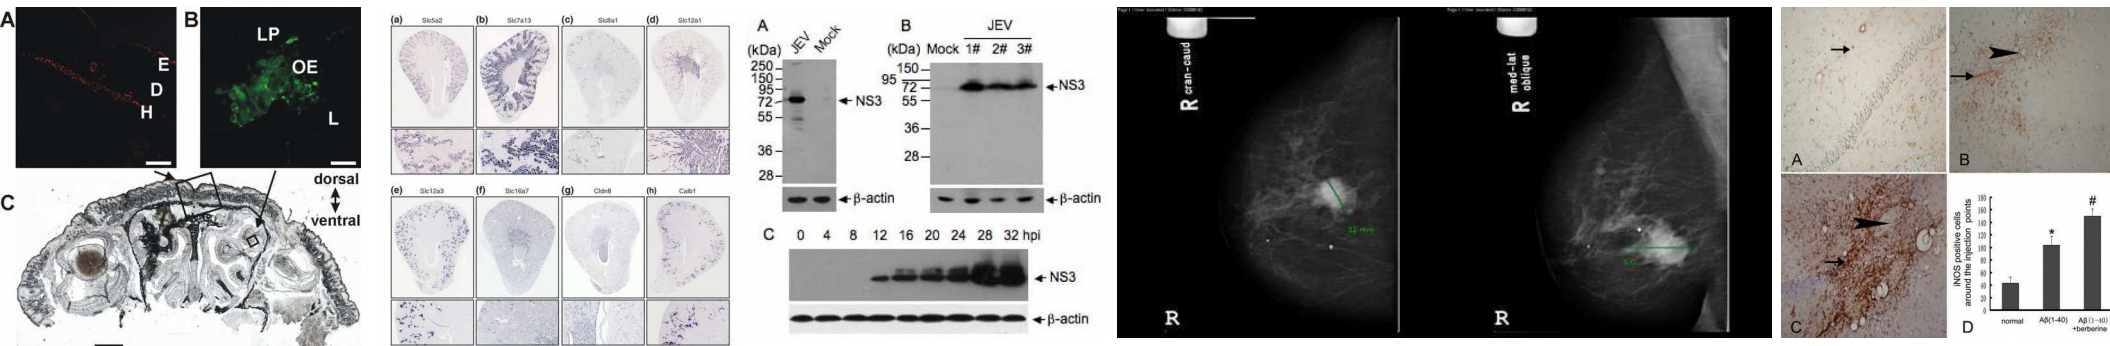

- Medical - ImageCLEFmed (12th edition)
 - Figures from biomedical literature
 - Identification, multi-label classification and separation of compound figures
 - Caption prediction (new subtask)
- Scalable Concept Image Annotation (5th edition)
 - Concept detection and localization in web images
 - Generation of sentence descriptions of the content
 - Illustrating text with images
- Handwritten Scanned Document Retrieval (1st edition)
 - Retrieval of image segments for multi-word queries

The Medical Task

ImageCLEFmed

Compound figure separation and multi-label classification; figure caption prediction

(12th edition)

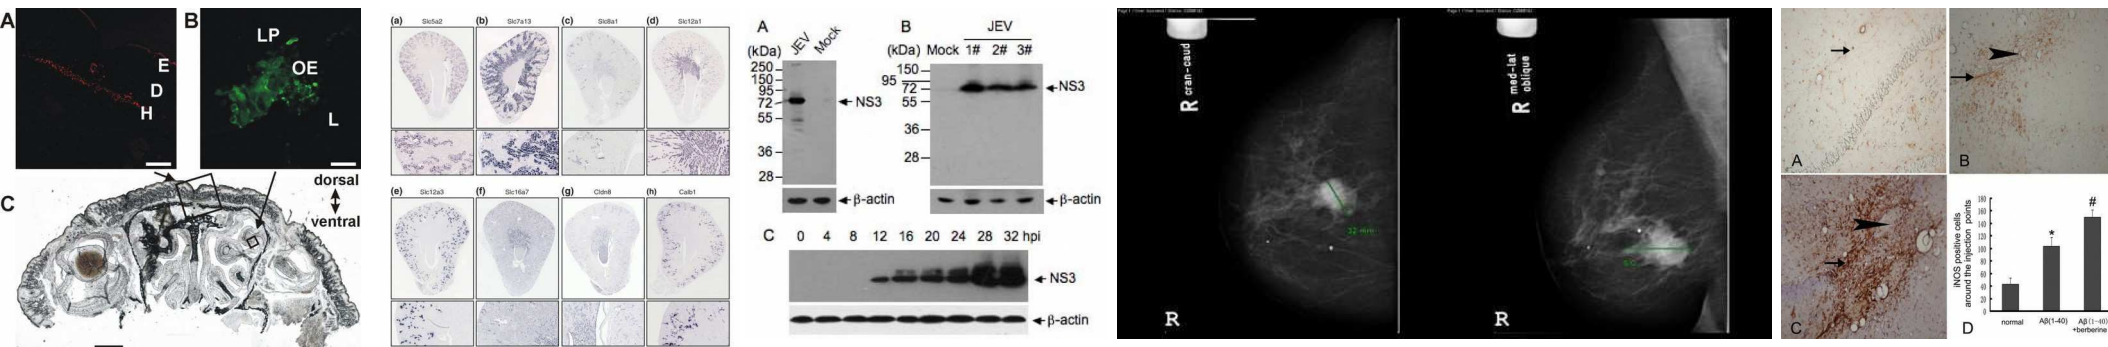

Motivation and aim

- Motivation:

- About 40% of figures in PubMed Central are compound figures
- In digital articles often compound figures are available as a single image block without information of its parts
- The compound figures need to be handled by image indexing and retrieval systems

- Aim:

- Develop techniques to handle compound figures and predict figure captions in biomedical literature retrieval

Data and task

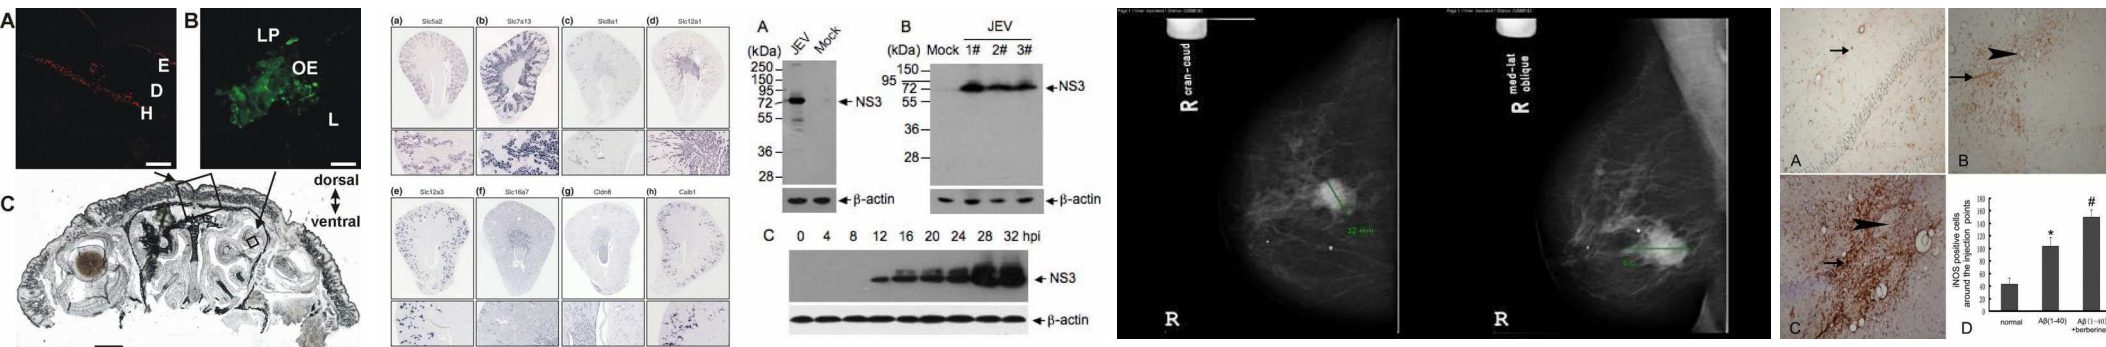

- **Tasks:**

- Compound figure detection (26,456 compound and single figures)
- Compound figure separation (8,397 compound figures)
- Multi-label classification (2,675 compound figures)
- Subfigure classification (10,942 sub-figures)
- Caption prediction (20,000 non-compound diagnostic figures)

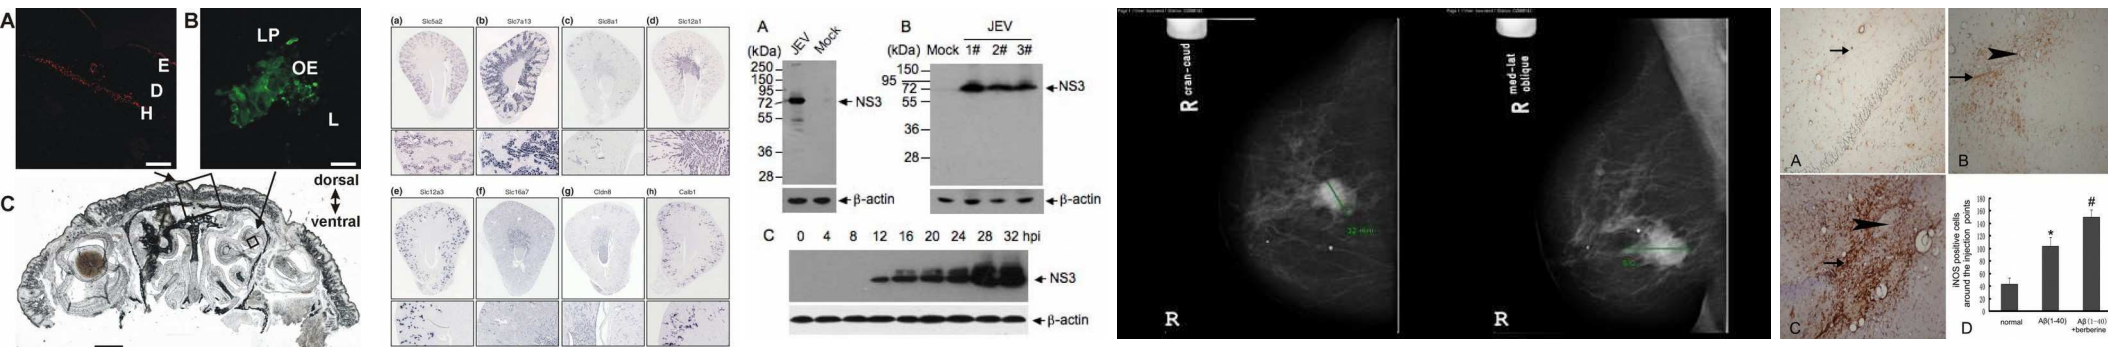

- **Dataset:**

- Subset of the of ImageCLEF 2013 dataset, part of PubMed Central

General information

- Past editions:
 - Current format since 2015
 - Compound figure separation subtask in 2013
 - Figure classification subtask since 2010
- Participation:
 - Eight groups participated, 69 system runs in total
 - No participants in caption prediction task

Results and observations

- Around 90% accuracy in:
 - Compound figure detection
 - Subfigure classification
- 84% accuracy in compound figure separation
- 0.0131 Hamming loss for multi-label classification
- Prominent use of CNNs
- Connected component analysis for figure separation

Scalable Concept Image Annotation Task

Concept Annotation, Localization, Sentence
Generation and Text Illustration

(5th edition)

Motivation and aim

- Motivation:
 - Users struggle with the ever-increasing quantity of data available to them
 - Large number of images cheaply found and gathered from the Internet
 - More valuable is mixed modality data, web pages of both images and text
- Aim:
 - To develop techniques to allow computers to reliably describe images, localise the different concepts depicted in the images, generate a description of the scene and retrieve relevant images, using noisy mixed modality data

28/07/16

chist-era

Data and task

- 4 subtasks: single dataset of 510k webpages, images + text
 - Test set \subset training set (unknown to participants)
- Subtask 1: Image localisation/detection
 - For each of the 510k images, annotate+localise with 251 concepts
- Subtask 2: Natural language caption generation
 - Generate textual descriptions for all 510k images
- Subtask 3: Content selection
 - Given labelled bounding box instances for 450 test images as input, select the instances most likely to be mentioned by humans in a description

Data and task

- Teaser task: Text Illustration (new for 2016)
 - Given a piece of text, select the most relevant image to illustrate it (out of 200k)
- 510k dataset split into 310k for training and 200k for testing

Results and observations

Subtask 1

- All approaches using exist CNN structure VGG
- Impressive performance
- Not using the provided web data much – too noisy?
- All image based features

Subtask 2

- Varied approaches
 - Deep learning
 - Template based

Results and observations

Subtask 3

- Teams focused on obtaining high recall
- Deep learning not used directly

Teaser task

- IR queries
- Mapping onto common multimodal space

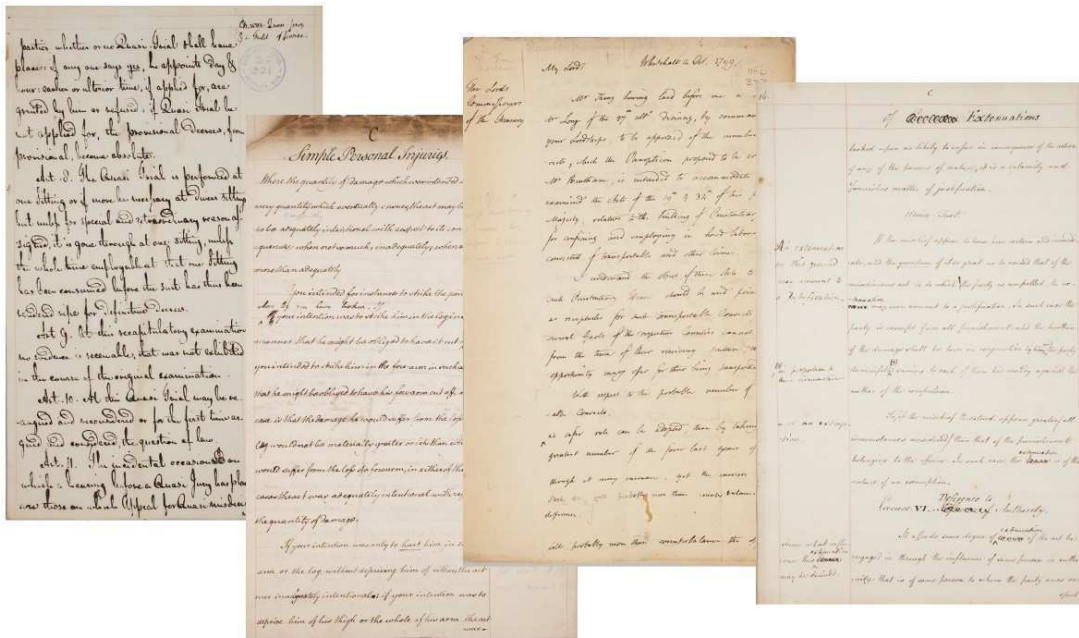

Handwritten Scanned Document Retrieval Task

Retrieval of image segments for multi-word queries

(1st edition)

Motivation and aim

- Motivation:
 - Currently there is a boom in digitization (scanning) of books, a large percentage being handwritten
 - Information access tools required to ease searching these handwritten collections
 - Automatic recognition of scanned handwriting is not as mature as for printed text
- Aim:
 - Develop indexing and retrieval techniques for handwritten documents that deal with its particular challenges

Data and task

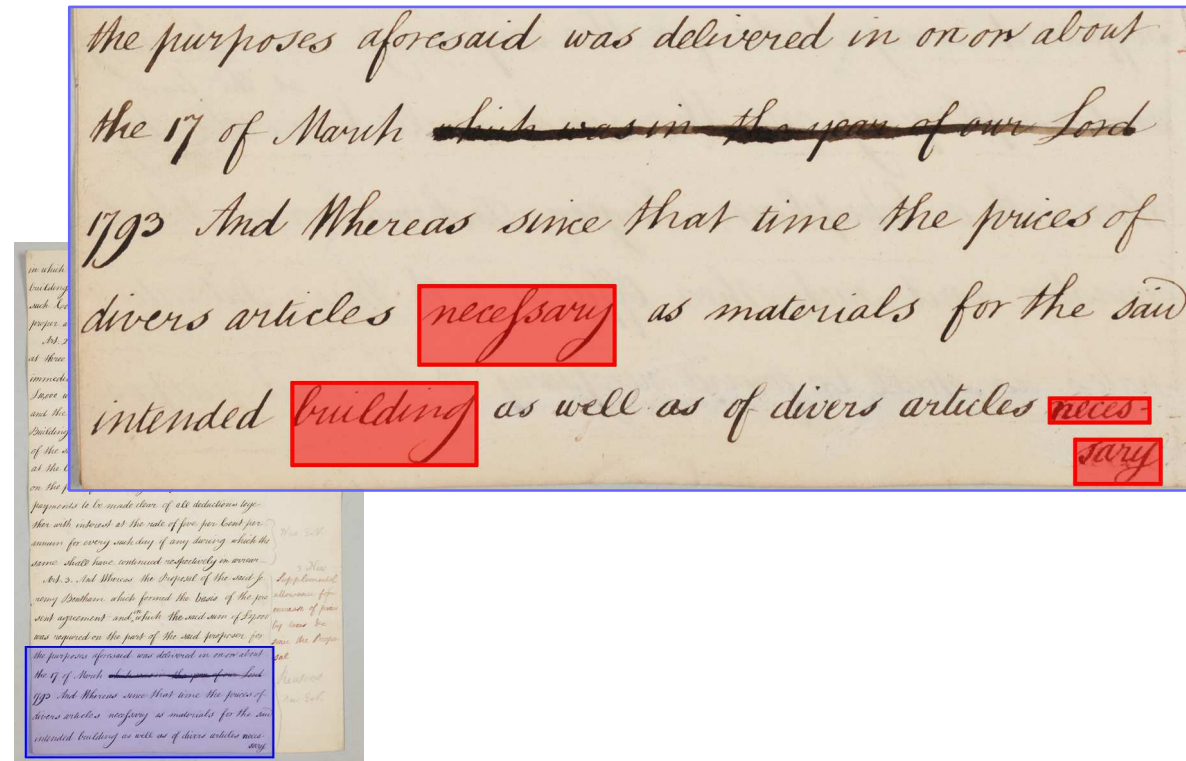

Dataset:

- Jeremy Bentham manuscripts (996 pages: 363 training, 433 development, 200 test)
- Provided page images, pre-extracted line images and 100-best recognitions using baseline system

Task:

- Retrieve 6-line segments for multi-word queries
 - Segments traverse pages
 - Broken words
 - Words unseen in training
 - Queries with zero results
 - Queries with repeated word

Query: building necessary

Results and observations

- Participation:
 - Four groups participated, 37 system runs in total
- Good performance obtained, in particular:
 - Words unseen in training
 - Words broken between lines
- Handling of broken words only based on the detection of hyphenation symbols

Wednesday September 7

13:30 – 14:50	Task overview presentations
14:50 – 15:30	Participant oral session 1
15:30 – 16:15	Participant poster session
16:15 – 17:35	Participant oral session 2
17:35 – 18:00	General discussion, feedback and future

Thursday September 8

10:30 – 11:20	Best of Labs 2015: ImageCLEF
